

SECTOR ONE-PAGER

Insurance: make official documents verifiable.

Docseal helps issuers and verifiers reduce document fraud in insurance workflows by comparing the received file with the sealed official reference.

Documents concerned

Insurance certificates, information statements, claims or subscription records.

Typical fraud

Modified coverage dates, altered bonus/malus, falsified attestations.

Who verifies

Insurers, brokers, banks, employers and digital platforms.

Docseal value

Confirm that a certificate or record was actually issued by the insurer.

Verification model

1

Seal

Issuer creates a seal and registry status.

2

Share

Recipient shares the document with a third party.

3

Verify

Verifier checks file hash against the sealed reference.

Pilot idea: Seal one certificate family and provide a verification URL for partners.

Why now?

Document fraud is increasingly hard to detect once files leave the issuer. Docseal adds an independent authenticity check without forcing the issuer to expose sensitive content.

Entry point

Start with one document family, one issuer and one verification workflow. Use a 4-6 week controlled pilot to measure fraud detection and operational fit.
