# Public Administration: make official documents verifiable.

Docseal helps issuers and verifiers reduce document fraud in public administration workflows by comparing the received file with the sealed official reference.

## Documents concerned

Tax certificates, permits, official attestations, compliance documents.

## Typical fraud

Altered fiscal status, fake official certificates, expired documents reused.

## Who verifies

Administrations, banks, regulated companies and public services.

## Docseal value

Provide public or controlled verification for official documents.

## Verification model

1

### Seal

Issuer creates a seal and registry status.

2

### Share

Recipient shares the document with a third party.

3

### Verify

Verifier checks file hash against the sealed reference.

**Pilot idea:** Pilot with a single public certificate or attestation type.

## Why now?

Document fraud is increasingly hard to detect once files leave the issuer. Docseal adds an independent authenticity check without forcing the issuer to expose sensitive content.

## Entry point

Start with one document family, one issuer and one verification workflow. Use a 4-6 week controlled pilot to measure fraud detection and operational fit.
